

1. I don't think the current system is adequate because it cannot be preventative. If Airbnb doesn't validate numbers before letting the rental run, it's possible that uncompliant rentals could be set up faster than could be reported and dealt with by a slow bureaucracy. This would not be an issue if Airbnb themselves cross-checked policy numbers for validity with government databases.
2. One factor that is important to consider when discussing the legality of web scraping is the intent of the scraper. If someone, like the researchers in Sandvig v Barr, was scraping for the purpose of research and testing algorithms, I don't think the website should be able to stop them because letting opaque algorithms have an outsized impact on something like the job market is a terrible idea. However, if a company is using scraping to collect user data for sale, even if public data, it shouldn't be allowed. Essentially, people should be able to investigate websites, not the other way around.
3. 1) Is there a reasonable expectation that this data would be private when it was given by the user? So many people are completely unaware of how their data could be accessed because of a lack of computer knowledge and taking advantage of them by harvesting data that would seem secure to the layman. 2) Will the aggregated data be harmful? Even if some pieces of data are harmless on their own, an aggregation of racial, socioeconomic, or other data could be used to specifically target groups of people, like Cambridge Analytica's use of demographics to influence an election by targeting the most vulnerable to mis/disinformation.
